

Maximize the Security of Your Patient Data

The OP Cloud allows clients to protect their data and practice in ways that make it easier and more secure than ever before.

Security Is Our Top Priority

Having to maintain a server in your practice can be costly and unpredictable, especially if you don't have dedicated, top tier IT support. In today's world, the Protected Health Information (PHI) at your practice is very desirable to hackers and criminals. Doctor's offices are the largest source of PHI breaches. With technology and security standards constantly changing, there's never been a better time to consider the OP Cloud solution.

By accessing OP via the cloud, you will no longer have to worry about:

Server Setup & Maintenance

Software to securely access the OP Cloud is installed on each device/workstation. OP also maintains all third party services, such as Electronic Prescriptions, Labs, Claim Transmissions to supported clearinghouses, and more.

Windows Limitations

OP Cloud can be utilized on most Windows and Mac devices.

OP Updates

All OP Cloud updates are administered by our technical support team, keeping you on the latest version as they become available.

OP Backups

All backups are run by OP nightly and are stored offsite in a safe, secure location.

The Power of the OP Cloud Solution

OP offers a secure and HIPPA-compliant cloud solution that works hand-in-hand with your EHR and PM software. This provides you with a reliable and efficient way to create and maintain your patient records. You can access OP on your desktop, laptop or mobile device - anywhere you have an internet connection!* The OP Cloud is hosted in a maximum security AWS environment, that utilizes the latest and greatest hardware available. With 24x7 camera security, communications between client workstations and AWS are SSL encrypted to protect PHI.
